

Flywheel Energy Storage Industrialization

Overview

Flywheel energy storage (FES) works by accelerating a rotor (flywheel) to a very high speed and maintaining the energy in the system as rotational energy. When energy is extracted from the system, the flywheel's rotational speed is reduced as a consequence of the principle of conservation of energy; adding energy. A typical system consists of a flywheel supported by connected to a. The flywheel and sometimes motor-generator may be enclosed in a to reduce friction and.
