

# Grid-connected power generation plan for wind power projects

## Overview

Because transmission planners are required to study wind technologies' impact on the grid, wind generation dominates the interconnection queues and the need for generic, standard, and validated publicly available models for variable generation technologies. These projects provide clean, sustainable energy to communities while reducing reliance on fossil fuels. To reach this goal, new wind power capacities with a total output of around 100 GW need to be installed in the EU by 2030. Understanding the connection of wind turbines to the power grid is crucial for comprehending how renewable energy is harnessed and integrated into our daily lives. Wind energy is one of the fastest-growing renewable energy sources worldwide. In this article, we'll explore how wind turbines are becoming more competitive in many locations. Around the world, 80 countries are using wind power on a commercial basis.
