

High voltage battery pack connected in series

Overview

The basic concept when connecting in series is that you add the voltages of the batteries together, but the amp hour capacity remains the same. As in the diagram above, two 6 volt 4.5 ah batteries wired in series are capable of providing 12 volts (6 volts + 6 volts) and 4.5 amp hours. This is where most tutorials end, but. In theory, a 6 volt 5 Ah battery and a 12 volt 5 Ah battery connected in series will give a supply of 18 volts (6 volts + 12 volts) and 5 Ah. A 6 volt. In theory a 6 volt 3 Ah battery and a 6 volt 5 Ah battery connected in series would give a supply of 12 volts 3 Ah (the capacity of the weaker battery). When connecting batteries in series, the general advice is to use batteries of the same ratings and the same make and model in order to minimize differences in exact voltage and amperage. Note, we say 'minimize', because even. As covered in the section Connecting batteries of different voltages in series above, the greater the differences in either voltage or amp hour rating, the more the discharging and recharging is unbalanced and the more.

How to measure voltage of multiple batteries ...

For example for the above circuit the measured voltage across battery-1 is 48v and battery-2 is 36v. Negating $48v - 36v = 12v$ gives us battery-1 voltage. Similarly if battery-3 is at 23v. Then $36v - 23v$ gives 13v. So battery-2 is supplying 13 volts ...
