

How to charge an 80A battery

Overview

There are many types of charger available; their working principles and the procedure for using these is given below. The latest generation of chargers is able to check the battery condition, and to supply automatically a controlled charge that will charge the battery in the fastest time without damaging it and. These maintain a fixed, constant, pre-set current throughout the charging period irrespective of the battery on-charge voltage. Do not charge. The majority of commercial chargers, particularly home-chargers, are of this type, and allow neither the voltage nor the current to be preset. Use the same procedure as for Constant. These maintain a fixed, constant, pre-set voltage throughout the charging period. The current cannot be set and will fall as the battery state-of-charge increases. Charging Procedure with Constant Potential and Modified.

Outback fm 80 charge controller set up

Total PV array power is another spec to which to pay strict attention. The rough calculation is charge controller maximum current (80A) x battery nominal voltage (24V). $80A \times 24V = 1920W$. Round up to 2000W and you have an array that's not likely to damage anything, or void the warranty. 2500W runs a pretty good chance of doing both.
