

## Microgrid common coupling point

### Overview

The Point of Common Coupling (PCC) is the electrical point where the micro-grid connects to the main utility grid. The ability to generate, store, and distribute power locally allows microgrid systems to maintain a stable and reliable point of common coupling (PCC) is typically the location where a microgrid. Solutions for Islanding and Grid-Connected Operation of a Microgrid Automatic separation systems detect an unstable or failing macrogrid and proactively island your microgrid power system to avoid blackouts. Microgrids play a crucial role in enhancing energy system resilience, reliability, and sustainability by offering localized power generation and distribution capabilities. It serves as a demarcation point, defining the boundary between the public utility network and the customer's private electrical installation. At the PCC the. Microgrids essentially consist of a collection of Distributed Energy Resources (DERs).
