## Overview

A photovoltaic cell is a type of PN junction diode which harnesses light energy into electricity. They generally work in a reverse bias condition. It is analogous to a solar cell since they belong to similar working principles but have distinct differences. Want to know more about this Super Coaching?

Explore SuperCoaching Now The diagram above is a cross-section of a photovoltaic cell taken from a solar panel which is also a type of photovoltaic cell. The cell consists of each a. A photovoltaic cell works on the same principle as that of the diode, which is to allow the flow of electric current to flow in a single direction and resist the reversal of the same current, i.e, causing only forward bias current. When light is incident on the surface of a cell, it consists. Some main applications of photovoltaic cells are as follows. 1. Can be used in making solar farms, which would generate gigawatts of electricity. 2. In difficult topographical conditions photovoltaic cells would efficiently deliver electricity than the conventional source. 3.
