

Photovoltaic grid-connected nuclear phase is a nuclear inverter

Overview

This project models and simulates a 5 MW grid-connected photovoltaic (PV) system using a 3-phase voltage-source inverter (VSI) in MATLAB/Simulink. It demonstrates PV. Whether the application is a solar calculator with a PV array of less than 1 W or a 100 MW grid-connected PV power generation plant, all that is required between the solar array and the load are electronic and electrical components. A grid-tied solar system has a special inverter that can receive power from the grid or send grid-quality AC power to the utility grid when there is an excess of energy from the solar. Grid-connected PV inverters (GCPI) are key components that enable photovoltaic (PV) power generation to interface with the grid. Their control performance directly influences system stability and grid connection quality. In order to harvest the energy out of the PV panel, a Maximum Power Point Tracking (MPPT) algorithm is required.
