

Solar Photovoltaic Power Station Grounding Rules

Overview

Grounding helps stabilize the system's voltage relative to the earth. While Article 250 provides the general rules, NEC Article 690, Part V, modifies and adds specific requirements for PV generators and their unique characteristics. This process involves two distinct but related concepts: system grounding, which provides a reference to earth for the electrical system (stabilizing voltages and assisting in clearing certain faults), and equipment grounding, which bonds all normally non-current-carrying metallic parts to provide. Grounding (also known as earthing) is the process of physically connecting the metallic and exposed parts of a device to the earth. It is a mandatory practice required by NEC and IEC codes to protect both equipment and personnel from damage and electric shock hazards. This article covers grounding. Abstract—This paper presents basic guidelines on design considerations for large utility-scale photovoltaic (PV) solar power plant (SPP) substation and collector grounding systems for safety aspects. It protects against electrical shocks, safeguards expensive equipment, and ensures stable performance. Operational aspects and influence of a PV plant on the distribution network differ from other conventional generators as follows:
