

Solar inverter costs

Overview

In a solar PV system, a solar inverter (or solar panel inverter) is essentially the gateway between your panels and your home. Any electricity that your panels generate must pass through this corridor before it can be used to power your premises. But what's the point of this middle man?

Well, solar panels create direct current. If you're getting a standard string inverter for residential solar panels, the cost will typically range from £500 to £1,000, depending on the size of your system. Meanwhile, microinverters. There are three different kinds of solar inverter that you can use with your solar panels. As is the case with any sensible industry, you get what you pay for. A string solar inverter will usually last around 10 years before needing a replacement. However, there are a handful of premium string inverters. Well, it's never quite as simple as 'I have a 4kW solar PV system, so I need a 4kW inverter'. Each solar inverter has an 'initial input voltage' (the minimum amount of electricity required to get it fired up), and a 'maximum input voltage'.
