

Solar inverter current ripple principle

Overview

These ripples are produced by the chopping effect of inverter switches, causing the DC-link current to fluctuate around the required average current, consequently requiring a large DC-link capacitor. In a single-phase photovoltaic power generation system, a 120 Hz ripple voltage occurs in the DC-link capacitor due to the use of a full-bridge inverter. By. Almost any solar systems of any scale include an inverter of some type to allow the power to be used on site for AC-powered appliances or on the grid. Different types of inverters are shown in Figure 11. The interleaved superposition of the DC link currents in these systems can potentially be adjusted. After that, based on LCL filter model for high order harmonic, the impact on ripple inhibition and resonant frequency caused by different filter parameters and scale factor is analyzed, Which provides a basis for design of LCL output filter parameters. Finally, calculations are made. A comparative analysis is performed to.
