Vanadium in 2022 for the first time, surpassing chemicals & catalysts, and titanium alloys. Steel continues to be the largest consumer of vanadium, however, this shift in the use of vanadium in energy storage highlights a trend that global annual VRFB deployments would reach approximately 32. With steel still dominating vanadium demand (accounting for 94% of US consumption in 2023), this surge in battery use is expected to put significant pressure. Vanadium flow battery market could be worth around half a billion dollars by end of the decade, with UK Infrastructure Bank among the investors that predict a big future for the industry - however, China dominates global vanadium production and the mineral looks particularly vulnerable to price. Vanadium is a transition metal known for its remarkable ability to exist in multiple oxidation states (from +2 to +5). This property allows it to participate in diverse redox reactions, making it essential in many chemical and industrial applications. Compounds such as V_2O_5 , NH_4VO_3 (ammonium. Energy storage systems are used to regulate this power supply, and Vanadium redox flow batteries (VRFBs) have been proposed as one such method to support grid integration.
