

## What is the generator of a container ship

### Overview

A genset (generator set) is an external generator that powers the refrigeration unit of a reefer container. Gensets are typically used in situations when reefer containers are stored or transported on a vessel, train or truck, and require an external power source. Years of use in the rental, oil and gas, mining and other heavy-duty industries have tested the reliability, usability and durability of our containerized generators. Our primary design challenges in developing this line of containerized generators were usability, reliability and functionality for. Containerized diesel generator sets, also known as container-type generator sets or container diesel generators, are integrated power solutions that enclose a diesel engine, alternator, control panel, fuel tank, and cooling system within a standard shipping container. The generator consists. This is the auxiliary engine — also known as the diesel generator.
