

# Why is the construction of photovoltaic panels free of charge

## Overview

Solar energy is a form of renewable energy, in which sunlight is turned into electricity, heat, or other forms of energy we can use. It is a “carbon-free” energy source that, once built, produces none of the greenhouse gas emissions that are driving climate change. Photovoltaics (PV) is the conversion of light into electricity using semiconducting materials that exhibit the photovoltaic effect, a phenomenon studied in physics, photochemistry, and electrochemistry. A single PV device is known as a cell. An individual PV cell is usually small, typically producing about 1 or 2 watts of power. There are several ways to turn. A solar module comprises six components, but arguably the most important one is the photovoltaic cell, which generates. When this material is exposed to photons of sunlight (very small packets of energy) it releases electrons and produces an electric charge.
